

LASER DENTAL TREATMENT NOW AVAILABLE BY DR. WADE

Dental lasers have been available for about 7 years, but they fell short of providing what they promised. I've been following the research on dental lasers for these years and we have now found a medical/dental laser manufacturer that has made a laser that will accomplish the procedures that will help children.

Based on this, our practice has acquired lasers for hard tissue (teeth) and soft tissue that treats canker sores, tongue ties, frenum pulls between teeth and other procedures with minimal anesthetic.

The really fantastic news is the hard tissue (tooth) laser. If a tooth can be treated with the laser, we will seldom need anesthetic for it! The laser is a focused beam of energy that can numb a tooth and remove decay also.

Again, we can't use it for every procedure, but for the ones we can, it will be quick and not usually need anesthetic.

We pride ourselves on providing a great visit for your child and this is a giant leap into the future of fun dental treatment. Feel free to ask me more about the lasers.

Thanks for being part of our practice!

Sincerely,

Dr. Wade
